

SpecStyle

Executable StyleOps for AMD Radeon

Project Profile | AMD AI DevMaster Track 1

Local generation, explicit evidence, bounded repair

Submitted by [guan](#)

Actual Radeon Preview wall

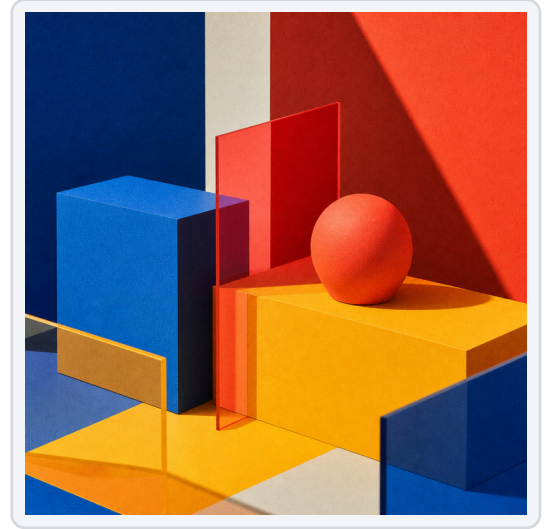

4 requested | 4 completed | 4 unique hashes | quality and diversity NOT_EVALUATED

A visual direction should behave like a contract

SpecStyle replaces copied prompts and sliders with a versioned, replayable execution contract.

Source content

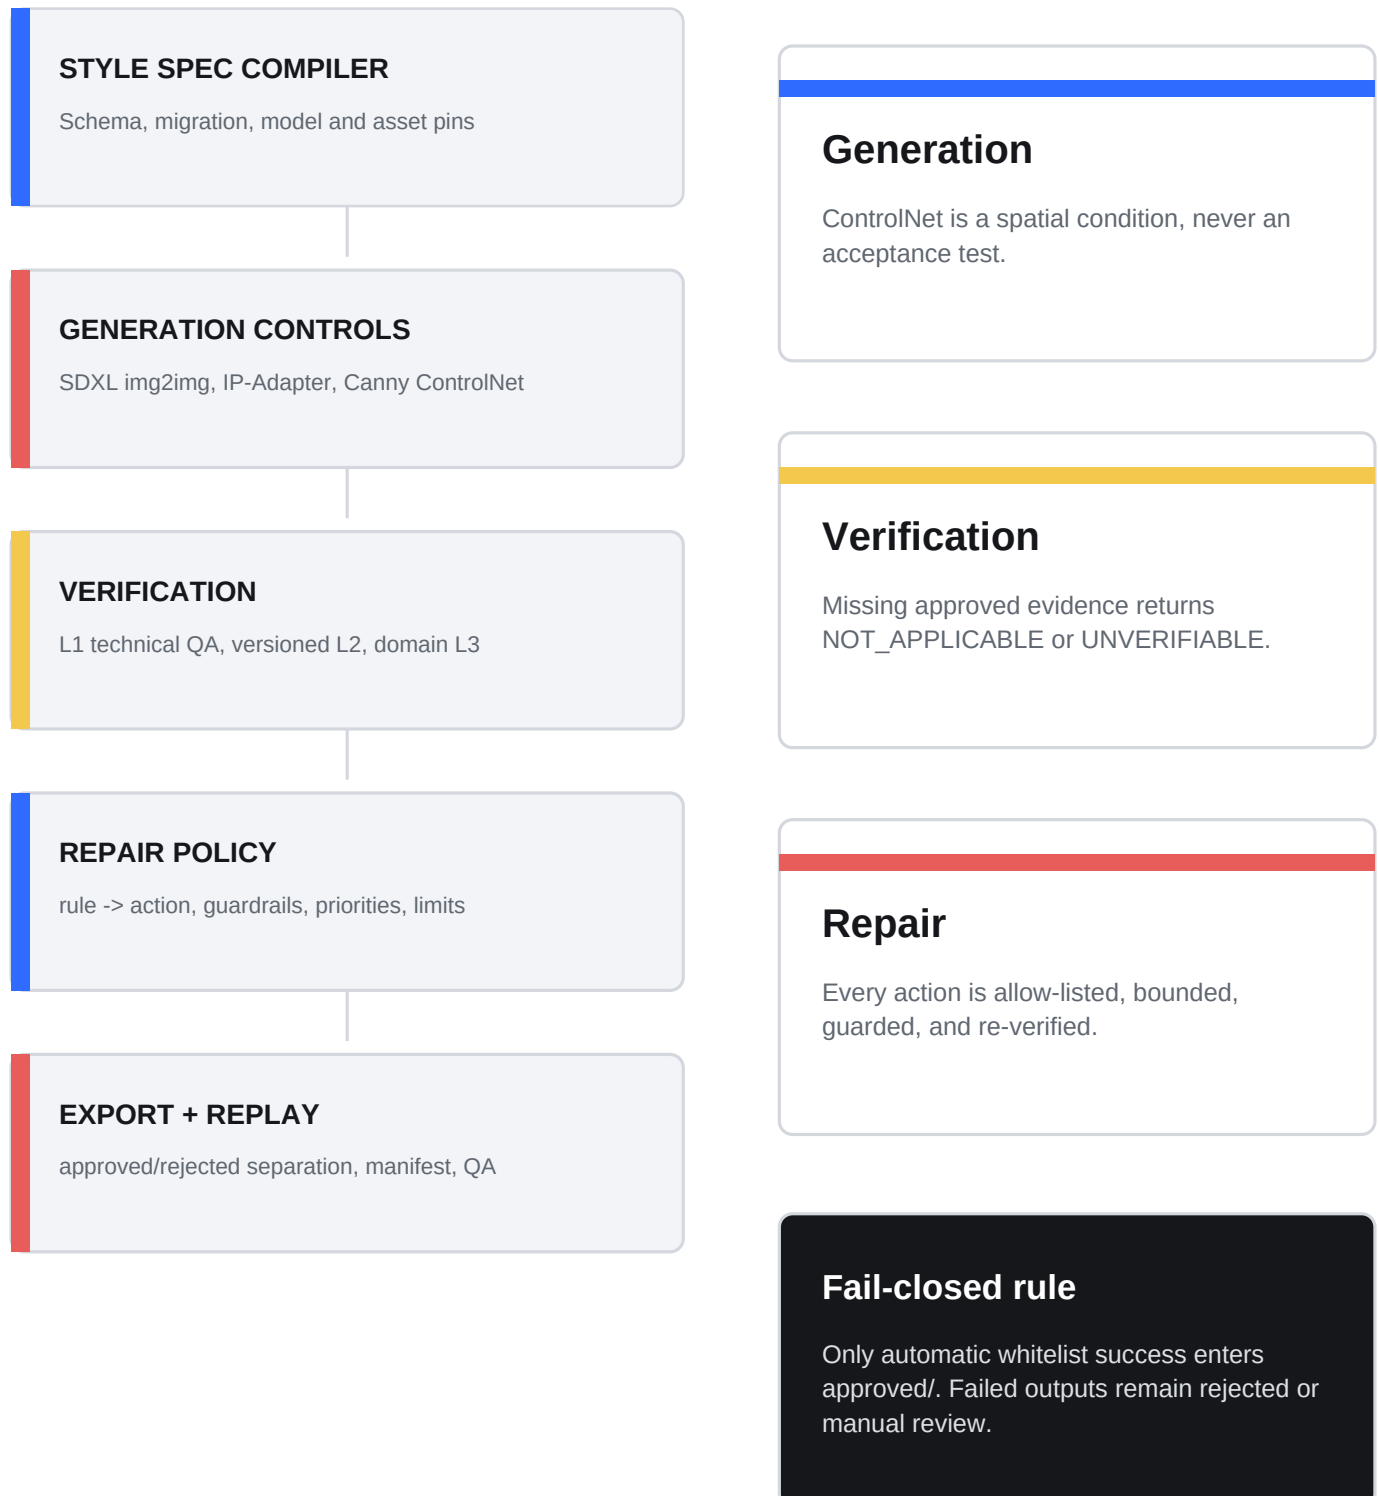

Style direction

Who uses it

- Brand and social-content teams preserving visual direction across people and batches.
- MCNs and studios producing platform-specific packages with approved and rejected routing.
- Individual creators using fast Preview without weakening Production governance.
- Evaluation operators requiring immutable inputs, deterministic evidence, and explicit unverifiable states.

Three planes keep controls, gates, and repair honest

Generation changes pixels, verification measures rules, and repair selects bounded actions.

One Spec compiles to separate Preview and Production graphs

The profiles share a pinned model family but have different execution and evidence contracts.

Preview

- LCM-LoRA SDXL with LCMScheduler
- 512 x 512, four steps, direction feedback
- One-to-four sequential engineering wall
- Deterministic seed, content hash, execution fingerprint
- Never routed into the approved Production package

Production

- Pinned SDXL base quality path
- Output profiles for 1080 x 1080, 1080 x 1440, and 1920 x 1080
- L1/L2/L3 routing with explicit unverifiable states
- Bounded repair and full affected-rule re-verification
- Approved/rejected isolation, bundle manifest, and QA report

Local model topology

SDXL base	shared latent image family; local-only, hash verified
IP-Adapter Plus ViT-H	style-reference conditioning
ControlNet Canny	spatial structure control, not identity or QA
LCM-LoRA SDXL	isolated Preview acceleration

Runtime supply is accepted only when descriptors, revisions, manifests, file hashes, roles, families, entrypoints, and license approvals close over the same local bytes.

The candidate completed a real four-seed Gradio run on Radeon

The browser uploaded all inputs, checked readiness, submitted the wall, waited for GPU inference, and rendered the evidence.

Evidence is explicit about what is proven and what remains external

SpecStyle fails closed when the trusted labels, approvals, or domain evidence needed for a stronger claim are absent.

Proven in this submission

- Actual local Radeon Preview through the Gradio product UI
- Four completed deterministic attempts and four unique hashes
- Preview/Production separation and fail-closed routing
- Production exports for three pinned output profiles
- Replay, cancellation, evidence, and guarded repair infrastructure
- Pinned application dependencies without replacing ROCm Torch

Not claimed

- Calibrated L2 accuracy without approved held-out human labels
- A universal L3 threshold or generic face identity gate
- Human-perceived quality or diversity from unique hashes alone
- A Radeon repair uplift without a trusted Production threshold package
- Five-arm equal-budget ablation or blind human usable-yield results
- ControlNet as identity verification

Inspect the evidence, not a marketing claim
